

Description

Use the following description and attached designs to create a sample web app. The web application should be responsive in all devices.

The test apps will help us evaluate your ability to implement the frontend of given designs and specifications in react.

Please spend no more than 3 hours on this project . If you can't finish in time, just submit what you were able to accomplish in the time spent. Please setup the entire UI first, then go back and implement the functionality.

Functionality:

- When changing the segmented control on the top from green to red, the colors should dynamically change.
- When the number of columns is changed by the user, the # of columns below should change. The row height should dynamically affect the row height of all the columns
- Use an animation of your choice when the number of rows or row height changes.
- The bottom left "fixed to the bottom" section should be fixed to the bottom of the browser
- Implement truncating for the line item titles and subheader if the name is longer than the containing element.
- Use sass where applicable
